

caffe2-operator

A Rust crate for the Caffe2 operator library, which is in the process of being translated from C++ to Rust. This crate contains translations of some of the functions from the original C++ library, but some function bodies are still in the process of being translated.

Core Primitives

- `AsyncSchedulingNet`: a net that supports async scheduling of operators
- `GradientMakerStorage`: storage for gradient makers
- `Observable`: a type that can be observed by an `Observer`
- `OperatorInfo`: metadata for operators, such as input/output names and types
- `OperatorRegistry`: registry for operators
- `OperatorStorage`: storage for operators
- `Tracer`: a tool for tracing and profiling the execution of code
- `TracerEvent`: an event generated by a `Tracer`
- `Workspace`: a workspace for storing blobs and nets

Core Algorithms

- `GradientNotImplementedYet`: an algorithm for handling gradient operations that are not yet implemented
- `GradientOpsMeta`: a metadata class that helps in computing gradients
- `GradientWrapper`: a wrapper for computing gradients
- `match_grads_to_params`: an algorithm for matching gradients to their corresponding parameters
- `operator_schema_test_*`: a set of algorithms for testing operator schemas, including cost inference, tensor inference, and inplace enforcement
- `run_on_device`: an algorithm for running an operator on a specific device
- `serialize_event`: an algorithm for serializing `TracerEvent` objects

Credits

This crate was developed by [INSERT YOUR NAME HERE] and is based on the Caffe2 operator library.
